The use of outcome data monitoring in the quality assurance of MI services

Matthew Jones & Pym Pettitt, Pharmacy Department, Royal United Hospital, Bath

Introduction
- In recent years, the effects of Medicines Information (MI) services on patient outcome have become a focus for research.
- Positive effects of an MI enquiry answering service for healthcare professionals (HCPs) have been demonstrated (1) & small scale projects have found similar benefits for patient helplines (2).
- If patient outcome data could be collected continuously through routine MI quality assurance programmes, they might provide a powerful tool for monitoring the quality & value of an individual MI service.

Discussion
- Questions regarding patient outcome can be included in regular MI user surveys whilst still achieving good response rates.
- The data obtained can be used to ensure the MI centre in question is working to a high standard & to demonstrate the patient value obtained from the provision of the service.
- HCP enquiry outcome questions are already validated & could be quickly incorporated into the national MI user survey.
- Further work is required to validate patient helpline outcome questions. This should be a high priority for future research.

Patient Helpline
- No validated tool to measure patient outcomes
- A simple survey was devised & distributed by post
- 49% response rate
- 29% of callers providing feedback over 18 months
- 100% of respondents stated that they found the advice they received helpful & that they followed it
- 98% of respondents stated that calling the helpline improved their experience of the hospital
- 19% Proportion of calls during which a medication error was identified & corrected

Healthcare Professional Enquiries
- Two key patient outcome questions (with rating scales) for HCP enquiries were validated in a recent national study (1):
  - How did the advice from MI affect your patient’s care or outcome?
  - How did the advice from MI affect the safety of your patient’s drug therapy?
- These questions were added to the standard national user survey. In other regards, the survey remained unchanged.
- 78% Response rate before & after adding outcome questions
- 68% 61% Proportion of respondents who answered outcome questions
- 86 Responses to outcome questions received over the first 2.5 years

Enquirers’ assessment of the overall impact of MI advice on patient care & safety. These figures are comparable with data from the original national study (1).

Outcomes:
1. Increasingly beneficial effects
2. No effect
3. Detrimental effect

Sources of advice if no helpline

Possible patient benefits
