The Light Controlled Factory

**Introduction and Methodology**

The Light Controlled Factory is the factory of the future. The Light Controlled Factory will use networks of light-based measurement systems to enable increased automation in manufacturing and the flexibility to evolve and adapt to changing demands. This will increase production capacity and drive down costs improving the competitiveness of the British high value manufacturing sector. The factory will be able to rapidly adapt and utilise new measurement-enabled production technologies as they reach technological maturity.

**Research Theme 1: Measurement assisted assembly technology with integrated processing machines**

**Challenges:**
- Robots have poor absolute accuracy
- Robots have poor stiffness
- Robots are not designed to machine!

**Proposed solution:**
- Robotic manipulator with machining/processing end-effector
- Real-time position compensation using large volume metrology
- 5/6 DOF tracking using dual laser tracker or laser tracker and (GPS) hybrid

Divide the task into low frequency and high frequency regions
- Laser tracker feedback for low frequency
- Active vibration damping for high frequency

**Research Theme 2: Model based and physical measurement methods for establishing the uncertainty of the spatial fidelity of large, complex tools and parts due to gravitational effects and thermal gradients**

**Challenges:**
- Large (5-30m), often compliant parts being assembled
- Thermal gradients in factories (3-5°C)
- Thermal variation (15°C over 24 hours)
- Gravitational loading
- Monolithic tooling
- Measurement uncertainty 1-5 mm

**Proposed Solution**
Development of a novel Hybrid Metrology System combining physical measurement and computational simulation

**Research Theme 3: A ubiquitous, 7D measurement environment for the entire factory space**

**Software tools are required:**
- Aid instrument selection
- Determine achievable tolerances for DIA and assembly process planning
- Optimize measurement network design
- Plan MAA processes and program MES
- Provide optimized measurements and associated uncertainties in real time by fusing data from multiple instruments and compensating for thermal effects
- Provide modules to control MAA processes and provide quality metrics within established MES and with respect to the uncertainty of measurements.

3DMPact: Multi-camera system for tracking and positioning of multiple objects

- Task requires multiple 6D data (X,Y,Z, roll, pitch, yaw) tracked over time, hence ubiquitous 7D system

**Multi-camera system**

**Dimensional accuracies in working space are improved by:**
- Many camera views which give multiple intersections of object targeting and mitigate environmental fluctuations
- Advanced camera models in conjunction with monochromatic imaging to eliminate distortions and optimise image quality

**Camera analyses** using selected monochromatic frequencies (red, green, blue, nir) show systematic variations, giving scope to improve accuracy. Example highlights principal distance variations.

A small-volume, multi-camera demonstrator has been assembled for system optimisation and performance testing against industry standards

**Identification of a part from within a high density set of measured coordinates, and comparison of the part to a ‘gold standard’ model has important applications including:**
- Robot Picking
- Process Control
- Dimensional Quality Control

**Novel Maximum Likelihood 6DOF Localiser**

- Surface matching is given by a Probability Density Function
- To match a view of the part to the gold standard, maximise the probability of all surface matches.

- Find a global optimum using a coarse match.

- Coarsely aligned views
- Then refine locally improving match 10x.

**Advantages**
- Unified Approach
- Avoid time consuming ICP algorithms
- Statistically Robust and Fast Runtimes

**Industrial Partners, Academic Network and Industrial Forum**

Following the success of the Light Controlled Factory track at the 2014 Digital Enterprise Technology International Conference, a new conference will be set up dedicated to Light Controlled Factory technologies.

We are building an Academic Network and Industrial Forum, if you are interested in joining either of these, please contact Prof. Paul Maropoulos: p.g.maropoulos@bath.ac.uk
