ABSTRACT

We introduce a new readability tutoring system, Read & Improve, a freely available online resource aimed at supporting learners of English and English Language Teaching (ELT) professionals by improving English learners' reading proficiency. Using a combination of machine learning approaches and natural language processing techniques, Read & Improve detects learning needs of every student and makes sure no learner is left behind by identifying reading content at an appropriate level of *readability* and helping learners acquire new words through accessible dictionary definitions and content exploration functionality.¹

1. INTRODUCTION

Reading is one of the fundamental language skills. Developing this skill is an essential part of language acquisition, both for native speakers and second language learners [9, 13]. At the same time, developing reading ability takes a considerable amount of time, and, as any learning process, it gets interrupted if readers lose motivation [8, 15]. Such factors as not having a range of engaging reading content offered and being presented with reading material at the wrong level of readability are some of the major contributors to the decreased motivation in readers [11]. In addition to language learners themselves, English Language Teaching (ELT) professionals face similar problems, as finding engaging reading content at the right level of readability is a challenging and a time-consuming task. In this paper, we present Read and Improve (*R&I*), a freely available, open-access educational system that is aimed at both language learners and teachers.²

¹This work has been done while the second author was a Senior Research Associate at the University of Cambridge. We thank Cambridge English for supporting this research via the ALTA Institute. We are also grateful to the anonymous reviewers for their valuable feedback.

²<https://readandimprove.englishlanguageitutoring.com/>

To ensure that the reading content provided to a learner is at an appropriate level of readability, *R&I* uses machine learning methods described in [18] to automatically label texts with readability levels corresponding to the Common European Framework of Reference for Languages (CEFR) [6]. The CEFR is an international standard that describes language ability on a six-point scale from A1 for beginners level up to C2 for advanced level of language proficiency.

To ensure that the reading content presented to a learner is engaging, *R&I* employs news articles that are sourced from news websites in real time. To source news content, *R&I* monitors both RSS Feeds from news websites and the publicly available Common Crawl News (CC-NEWS) Dataset.³ A fully automated *Indexing Pipeline* (RIIP, herein) processes article URLs from the RSS Feeds and CC-NEWS files and automatically labels the *readability* of each article's text. News articles are generally available for learners on *R&I* within 10 minutes of publishing on an RSS news feed and in 3-6 hours of the article's publishing time if sourced from CC-NEWS. As compared to other domains, news articles have the additional benefit of being generally free of grammatical and spelling errors, which allows us to achieve more reliable linguistic analysis and to provide learners with high quality reading content. *R&I*'s user interface (UI) enables learners to not only read the latest news articles but also to perform keyword search to find articles on topics that they are interested in at their desired CEFR level(s).

A number of applications for various groups of readers, including native and non-native speakers, readers with cognitive impairments, and children, to name just a few, have been developed in recent years. In contrast to the previous work [13, 16, 17], our platform is aimed specifically at developing reading ability in non-native speakers of English. Our approach bears similarities to the Read-X [14] and REAP [10] systems, while also being actively developed and supported as an open-access educational platform available online. *R&I* is markedly different from other available applications, as in addition to providing text search functionality (as in [5]) and vocabulary acquisition help (as in [4]), it supports comprehension testing and personalisation.

The rest of this paper is structured as follows: Section 2 provides an overview of the system's architecture, Section 3 describes the current UI functionality, and finally Section 4

³<http://commoncrawl.org/2016/10/news-dataset-available/>

concludes the paper and describes future work.

2. SYSTEM ARCHITECTURE

Figure 1 illustrates the system architecture of *R&I*. We do not describe the full details of system components or cloud resources and configuration here, as this is outside the scope of the paper. Instead, we provide a general overview of the components and their use of natural language processing (NLP).

2.1 API

The API connects to an information retrieval index (‘IR Engine’), a database (‘DB Engine’), and several APIs to provide the data and search functionality required by the UI. The IR Engine employs Elasticsearch⁴ (ES) and includes several distinct indices that facilitate search over news articles and other data.

2.2 RIIP

RIIP is responsible for processing articles into the ES article index. In order to prevent duplicate processing, the pipeline modules first check whether the output file(s) already exist in the ‘Data Lake’, a single store of all data processed. The API monitors the set of URLs listed in RSS feed(s) and the set of CC-NEWS files for new items, and if found, these are sent to RIIP for processing. Therefore, ingestion of new articles through the system requires no manual effort, and up-to-date news content is continuously processed and made available to learners via the UI.

RIIP modules include: the *Extractor*, that extracts text and other information from news articles (i.e. HTML); *RASP*, that parses the text to provide linguistic information [2];⁵ the *LevelMarker* module, that labels the text for readability (on the CEFR scale); and finally the *ES* module that indexes text and other linguistic information.

2.3 LevelMarker Module

For RIIP’s LevelMarker module we follow Briscoe et al. [3], and define the task of learning readability levels as a discriminative preference ranking task. We employ their machine learning (ML) software and use linguistic features outlined by Xia et al. [18] that represent a text’s readability.

2.3.1 Data

We have crawled three publicly available news websites to create datasets: Breaking News English (BNE)⁶ (2771 articles), News in Levels (NIL)⁷ (6373 articles) and Tween Tribune (TT)⁸ (7768 articles). These websites have news articles labelled in terms of their readability however each website’s readability levels are based on different scales as shown in Table 1.⁹ Each of these datasets are considered to be *parallel* as they contain multiple versions of the same articles simplified across different levels. While the BNE and

⁸<https://www.tweentribune.com/>

⁹BNE to CEFR level map provided by the website: https://breakingnewsenglish.com/news_levels.html

Table 1: Dataset levels and distributions.

(a) BNE			(b) NIL	
BNE level	CEFR level	Count	NIL level	Count
0	A2	386	1	2126
1	A2	386	2	2124
2	A2	386	3	2123
3	A2-B1	418		
4	B1-B2	392		
5	B2	392		
6	C1-C2	412		

(c) CER			(d) TT	
Exam	CEFR level	Count	TT level	Count
KET	A2	64	Grade K-4 (0)	1965
PET	B1	60	Grade 5-6 (1)	2029
FCE	B2	71	Grade 7-8 (2)	1771
CAE	C1	67	Grade 9-12 (3)	2003
CPE	C2	69		

Table 2: 5-fold cross-validation tests for each dataset.

Source	Pearson’s	Spearman’s	Kendall’s
BNE	0.8338	0.8368	0.6873
NIL	0.9217	0.9164	0.7880
TT	0.9055	0.9250	0.8071
CER	0.9155	0.9185	0.8015

NIL datasets are designed for L2 English learners, the TT is designed to help L1 learners (early and school-aged readers).

2.3.2 Evaluation

RIIP employs a model trained on the full BNE dataset as this dataset can be reliably mapped to the CEFR scale (Table 1). Based on this mapping we determined the ranges of ML scores that corresponded to each CEFR level (using observed score range from training data). We tested our model on the Cambridge English Readability (CER) dataset,¹⁰ a publicly available dataset of 331 texts spanning CEFR levels A2 to C2 [18]. On this test set, our model achieves 0.83 Pearson’s, 0.85 Spearman’s and 0.71 Kendall’s correlation coefficient. We also ran 5-fold cross-validation for each dataset¹¹ and present the results in Table 2.

2.4 ES index

In addition to article index, we create ‘WordInfo’ and ‘CALD’ indexes. The CALD indexing system processes definitions from the Cambridge Advanced Learner’s Dictionary (CALD) to populate the CALD index. The LexDoo system employs Hadoop¹² to process the Data Lake files (currently around 1 million articles) to produce raw frequency counts of linguistic properties for every word lemma.¹³ Following this step, these lemma statistics are collated and added to the ‘WordInfo’ index.

¹⁰<https://ilexir.co.uk/datasets/index.html>

¹¹We split the data randomly into training and test sets, ensuring an even distribution of class labels.

¹²Apache Hadoop: <https://hadoop.apache.org/>

¹³LexDoo is also used to process (any number of) CC-NEWS files in parallel, as required.

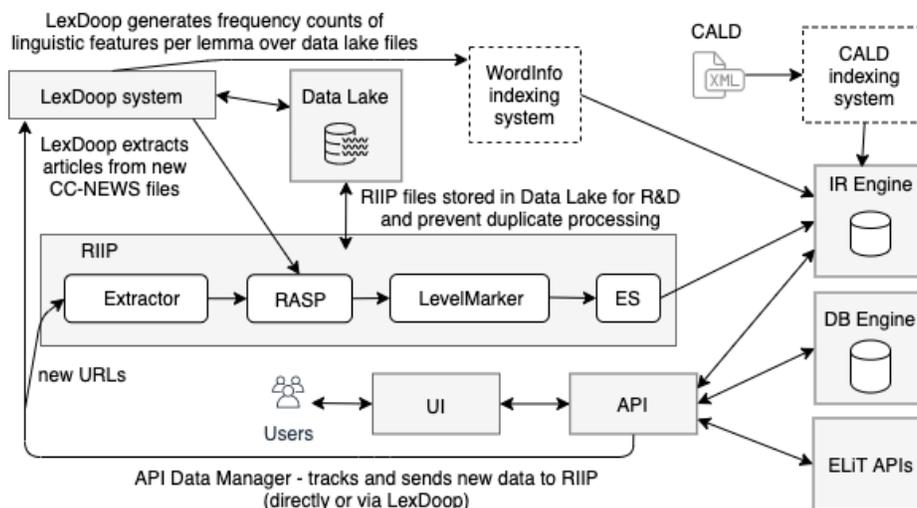

Figure 1: Overview of *R&I* architecture. *R&I* is hosted within, and relies upon, cloud computing services from Amazon Web Services (AWS). Components that use cloud AWS services are shown with grey backgrounds.

2.5 Sanitisation

To make sure the content provided on the platform is acceptable for a wide range of readers across various ages and cultures, we apply content “*sanitisation*” strategy, whereupon we automatically filter out news articles that contain words pertaining to the topics that might be considered offensive in some cultures or inappropriate for younger readers. The list of around 1600 such taboo words was curated using the lists of taboo words from social media. Sanitisation is run within RIIP and the API and, in case the sanitisation system makes an error, the UI enables admin users to mark articles as ‘unsafe’ (or vice versa).

3. READING ON THE PLATFORM

We define the *R&I* functionality in terms of four major aspects, which cover the tutoring system’s ability to provide learners and teachers with engaging reading content at the appropriate level of readability (§3.1); help learners develop their vocabulary in English (§3.2); run comprehension tests (§3.3); and allow learners to revisit texts they read, words they clicked on and tests they submitted (§3.4).

3.1 Finding engaging reading material at an appropriate level

The first step for learners accessing *R&I* is to define their language proficiency level. Learners can log in to *R&I* using their account credentials from Write & Improve,¹⁴ a freely available system linked to the reading platform, that is able to assess and provide feedback on a learner’s writing proficiency. Once logged in, *R&I* defaults reading proficiency to current writing proficiency, but a learner can change their CEFR reading level.

Figure 2 contains a screenshot of the *search page*’s results showing the latest news articles at the learner’s CEFR level (currently B1). The search page provides learners with snip-

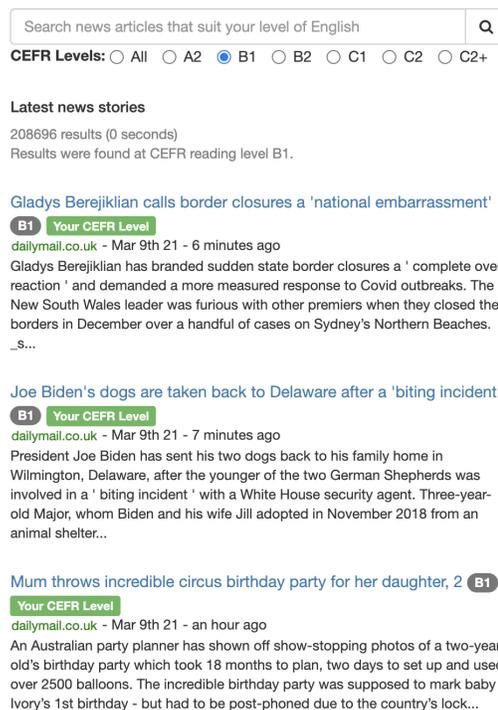

Figure 2: Screenshot: search results.

pet(s) of the article text, and they can click on any of the titles listed on this page in order to load the *article view page* where they can read the article itself. In addition, search by keywords is enabled on *R&I* to allow learners to find articles not only at their level of readability, but also on the topics of their interest.

3.2 Developing one’s vocabulary

Vocabulary is very important in language learning to the point that language learning itself would sometimes be equated
